

Customer Success Story – VNS™ Bonded ADSL

The client

“ We needed a creative solution to the pressing problem of lack of bandwidth. Multidata not only came up with a brilliantly cost effective proposal , they implemented it in no time at all and with no downtime. First Class all the way, these guys are great! ”

Shaun Wilkinson, Managing Director

The issue

When one of the UKs top printer and document handling companies found that their data transfer (bandwidth/speed) requirements to an office in Germany and their internet needs had increased beyond ordinary broadband they turned to Multidata, their existing supplier for ADSL and telephony for ideas.

Our solution

As a “business only” ISP and Telecoms provider with a long history of supplying creative network solutions, we first looked at leased line interconnectivity (InterStream). Unfortunately because of the geographic location of the Utax office, this wasn’t possible so a VNS™, (virtually non stop) bonded ADSL solution over 4 diverse circuits was proposed. This was implemented in just under 4 weeks and provided not only more than 23mgb of download bandwidth and 3mgb of upload bandwidth but also provided a totally resilient service due to the use of different ADSL networks. With the 24/7/365 monitoring as well the client has total peace of mind.

The result

Utax now enjoy fast efficient data communications between all their offices and have secure, failsafe connections for internet and customer applications with vastly increased bandwidth at a very low monthly cost.
